

Erdős Problem #719

EP-719

L1 - TRACTABLE

OPEN

Graph Theory

ORIGINAL PROBLEM STATEMENT

Let $\text{ex}_r(n; K_{r+1}^r)$ be the maximum number of r -edges that can be placed on n vertices without forming a K_{r+1}^r (the r -uniform complete graph on $r + 1$ vertices).

Is every r -hypergraph G on n vertices the union of at most $\text{ex}_r(n; K_{r+1}^r)$ many copies of K_r^r and K_{r+1}^r , no two of which share a K_r^r ?
