

Fixed-point logic with counting

OPG-37424

L1 - TRACTABLE

PARTIALLY SOLVED

Logic

ORIGINAL PROBLEM STATEMENT

Question Can either of the following be expressed in fixed-point logic plus counting:

- Given a graph, does it have a perfect matching, i.e., a set M of edges such that every vertex is incident to exactly one edge from M ?
- Given a square matrix over a finite field (regarded as a structure in the natural way, as described in [BGS02]), what is its determinant?
