

Erdős Problem #261

EP-261	L1 - Tractable	Partiellement résolu	Number Theory
--------	----------------	----------------------	---------------

Énoncé original (anglais, reproduction mot pour mot)

Are there infinitely many n such that there exists some $t \geq 2$ and distinct integers $a_1, \dots, a_t \geq 1$ such that $\frac{n}{2^n} = \sum_{1 \leq k \leq t} \frac{a_k}{2^{a_k}}$? Is this true for all n ? Is there a rational x such that $x = \sum_{k=1}^{\infty} \frac{a_k}{2^{a_k}}$ has at least $2^{\aleph_0}$ solutions?
