

Erdős Problem #341

EP-341	L1 - Tractable	Ouvert	Number Theory
--------	----------------	--------	---------------

Énoncé original (anglais, reproduction mot pour mot)

Let $A = \{a_1 < \dots < a_k\}$ be a finite set of positive integers and extend it to an infinite sequence $\overline{A} = \{a_1 < a_2 < \dots\}$ by defining a_{n+1} for $n \geq k$ to be the least integer exceeding a_n which is not of the form $a_i + a_j$ with $i, j \leq n$. Is it true that the sequence of differences $a_{m+1} - a_m$ is eventually periodic?
