

Erdős Problem #342

EP-342	L1 - Tractable	Ouvert	Number Theory
--------	----------------	--------	---------------

Énoncé original (anglais, reproduction mot pour mot)

With $a_1=1$ and $a_2=2$ let a_{n+1} for $n \geq 2$ be the least integer $> a_n$ which can be expressed uniquely as $a_i + a_j$ for $i < j \leq n$.

What can be said about this sequence? Do infinitely many pairs $a, a+2$ occur? Does this sequence eventually have periodic differences? Is the density 0 ?
