## Énoncé original (anglais, reproduction mot pour mot)

Let  $A \subseteqq \mathbb{N}$  be a complete sequence, and define the threshold of completeness  $T(A)$  to be the least integer  $m$  such that all  $n \geq m$  are in  $P(A) = \left\{ \sum_{n \in B} n : B \subseteqq A, \text{finite} \right\}$  (the existence of  $T(A)$  is guaranteed by completeness). Is it true that there are infinitely many  $k$  such that  $T(n^k) > T(n^{k+1})$ ?
