Énoncé original (anglais, reproduction mot pour mot)

For any $k \geq 2$ let $g_k(n)$ denote the maximum value of $(a_1 + \dots + a_k)^{-n}$ where $a_1, \dots, a_k$ are integers such that $a_1! \dots a_k! \mid n!$. Can one show that $\sum_{n \leq x} g_k(n) \sim c_k x \log x$ for some constant c_k ? Is it true that there is a constant c_k such that for almost all $n < x$ we have $g_k(n) = c_k \log x + o(\log x)$?
