Énoncé original (anglais, reproduction mot pour mot)

Let p_n be the smallest prime $\equiv 1 \pmod{n}$ and let m_n be the smallest integer such that $n \mid \phi(m_n)$.

Is it true that $m_n < p_n$ for almost all n ? Does $p_n/m_n \rightarrow \infty$ for almost all n ? Are there infinitely many primes p such that $p-1$ is the only n for which $m_n=p$?
