Let $a_0=0$ and $a_1=1$, and in general define a_k to be the least integer $>a_{k-1}$ for which $(n-a_k, n-a_i)=1$ for all $0 \leq i < k$. Does $\sum_{0 < a_i < n} \frac{1}{a_i} \rightarrow \infty$ as $n \rightarrow \infty$? What about if we restrict the sum to those i such that $n-a_j$ is divisible by some prime $\leq a_j$, or the complement of such i ?
