

Erdős Problem #461

EP-461	L1 - Tractable	Ouvert	Number Theory
--------	----------------	--------	---------------

Énoncé original (anglais, reproduction mot pour mot)

Let $s_t(n)$ be the t -smooth component of n - that is, the product of all primes p (with multiplicity) dividing n such that $p \leq t$. Let $f(n,t)$ count the number of distinct possible values for $s_t(m)$ for $m \in [n+1, n+t]$. Is it true that $f(n,t) \gg t$ (uniformly, for all t and n)?
