## Énoncé original (anglais, reproduction mot pour mot)

What is the size of the largest  $A \subseteq \mathbb{R}^d$  such that every three points from  $A$  determine an isosceles triangle? That is, for any three points  $x, y, z$  from  $A$ , at least two of the distances  $\|x - y\|, \|y - z\|, \|x - z\|$  are equal.
