

Erdős Problem #529

EP-529	L1 - Tractable	Ouvert	Graph Theory
--------	----------------	--------	--------------

Énoncé original (anglais, reproduction mot pour mot)

Let $d_k(n)$ be the expected distance from the origin after taking n random steps from the origin in $\mathbb{Z}^k$ (conditional on no self intersections) - that is, a self-avoiding walk. Is it true that $\lim_{n \rightarrow \infty} \frac{d_k(n)}{n^{1/2}} = \infty$? Is it true that $d_k(n) \ll n^{1/2}$ for $k \geq 3$?
