Énoncé original (anglais, reproduction mot pour mot)

For a graph G let $\tau(G)$ denote the minimal number of vertices that include at least one from each maximal clique of G (sometimes called the clique transversal number).

Is it true that if all maximal cliques in G have at least cn vertices then $\tau(G) = o_c(n)$?

Similarly, estimate for $c > 0$ the minimal $k_c(n)$ such that if every maximal clique in G has at least $k_c(n)$ vertices then $\tau(G) < (1-c)n$.
