Consider the triangular lattice with minimal distance between two points 1 . Denote by $f(t)$ the number of distances from any points $\leq t$. For example $f(1)=6$, $f(\sqrt{3})=12$, and $f(3)=18$.

Let $x_1, \dots, x_n \in \mathbb{R}^2$ be such that $d(x_i, x_j) \geq 1$ for all $i \neq j$. Is it true that, provided n is sufficiently large depending on t , the number of distances $d(x_i, x_j) \leq t$ is less than or equal to $f(t)$ with equality perhaps only for the triangular lattice? In particular, is it true that the number of distances $\leq \sqrt{3} - \epsilon$ is less than 1 ?
