

Erdős Problem #776

EP-776	L1 - Tractable	Partiellement résolu	Combinatorics
--------	----------------	----------------------	---------------

Énoncé original (anglais, reproduction mot pour mot)

Let $r \geq 2$ and $A_1, \dots, A_m \subseteq \{1, \dots, n\}$ be such that $A_i \cap A_j = \emptyset$ for all $i \neq j$ and for any t if there exists some i with $|A_i| = t$ then there must exist at least r sets of that size.
How large must n be (as a function of r) to ensure that there is such a family which achieves $n-3$ distinct sizes of sets?
