

Erdős Problem #805

EP-805	L1 - Tractable	Partiellement résolu	Graph Theory
--------	----------------	----------------------	--------------

Énoncé original (anglais, reproduction mot pour mot)

For which functions $g(n)$ with $n > g(n) \geq (\log n)^2$ is there a graph on n vertices in which every induced subgraph on $g(n)$ vertices contains a clique of size $\geq \log n$ and an independent set of size $\geq \log n$?

In particular, is there such a graph for $g(n) = (\log n)^3$?
