

Erdős Problem #87

EP-87	L1 - Tractable	Ouvert	Graph Theory
-------	----------------	--------	--------------

Énoncé original (anglais, reproduction mot pour mot)

Let $\epsilon > 0$. Is it true that, if k is sufficiently large, then $R(G) > (1 - \epsilon)^k R(k)$ for every graph G with chromatic number $\chi(G) = k$?

Even stronger, is there some $c > 0$ such that, for all large k , $R(G) > c R(k)$ for every graph G with chromatic number $\chi(G) = k$?
