If  $n = \prod_{1 \leq i \leq t} p_i^{k_i}$  is the factorisation of  $n$  into distinct primes then let  $f(n) = \sum p_i^{\ell_i}$ , where  $\ell_i$  is chosen such that  $n \in [p_i^{\ell_i}, p_i^{\ell_i+1})$ . Furthermore, let  $F(n) = \max \sum_{i=1}^t a_i$  where the maximum is taken over all  $a_1, \dots, a_t \leq n$  such that  $(a_i, a_j) = 1$  for  $i \neq j$ .
