Énoncé original (anglais, reproduction mot pour mot)

Conjecture For $c \geq m \geq 1$, let $P(c,m)$ be the statement that given any exact c -coloring of the edges of a complete countably infinite graph (that is, a coloring with c colors all of which must be used at least once), there exists an exactly m -colored countably infinite complete subgraph. Then $P(c,m)$ is true if and only if $m=1$, $m=2$, or $c=m$.
