Énoncé original (anglais, reproduction mot pour mot)

Conjecture Let F is a family of multifuncoids such that each F_i is of the form $\lambda j \in N \left(i \right): \frac{F}{\left(U_j \right)}$ where $N \left(i \right)$ is an index set for every i and U_j is a set for every j . Let every $F_i = E^{\ast} f_i$ for some multifuncoid f_i of the form $\lambda j \in N \left(i \right): \frac{P}{\left(U_j \right)}$ regarding the filtrator $\left(\prod_{j \in N \left(i \right)} \frac{F}{\left(U_j \right)}; \prod_{j \in N \left(i \right)} \frac{P}{\left(U_j \right)} \right)$. Let H is a graph-composition of F (regarding some partition G and external set Z). Then there exist a multifuncoid h of the form $\lambda j \in Z: \frac{P}{\left(U_j \right)}$ such that $H = E^{\ast} h$ regarding the filtrator $\left(\prod_{j \in Z} \frac{F}{\left(U_j \right)}; \prod_{j \in Z} \frac{P}{\left(U_j \right)} \right)$.
