Conjecture There is a finite upper bound on the multiplicities of entries in Pascal's triangle, other than the number 1 .

The number 2 appears once in Pascal's triangle, 3 appears twice, 6 appears three times, and 10 appears 4 times. There are infinite families of numbers known to appear 6 times. The only number known to appear 8 times is 3003 . It is not known whether any number appears more than 8 times. The conjectured upper bound could be 8 ; Singmaster thought it might be 10 or 12 . See Singmaster's conjecture.
