

Upgrading a completary multifuncoid

OPG-37385	L1 - Tractable	Partiellement résolu	Topology
-----------	----------------	----------------------	----------

Énoncé original (anglais, reproduction mot pour mot)

Let $\mathcal{M}$ be a set, $\mathcal{F}$ be the set of filters on $\mathcal{M}$ ordered reverse to set-theoretic inclusion, $\mathcal{P}$ be the set of principal filters on $\mathcal{M}$, let n be an index set. Consider the filtrator $(\mathcal{F}^n; \mathcal{P}^n)$.

Conjecture If f is a completary multifuncoid of the form $\mathcal{P}^n$, then $E^{\text{last}} f$ is a completary multifuncoid of the form $\mathcal{F}^n$.

See below for definition of all concepts and symbols used to in this conjecture.

Refer to this Web site for the theory which I now attempt to generalize.
