

Negative association in uniform forests

OPG-1757

L1 - TRACTABLE

PARTIALLY SOLVED

Graph Theory

ORIGINAL PROBLEM STATEMENT

Conjecture Let G be a finite graph, let $e, f \in E(G)$, and let F be the edge set of a forest chosen uniformly at random from all forests of G . Then

$$\mathbb{P}(e \in F \mid f \in F) \leq \mathbb{P}(e \in F)$$
