

Turán number of a finite family.

OPG-46706

L1 - TRACTABLE

PARTIALLY SOLVED

Graph Theory

ORIGINAL PROBLEM STATEMENT

Given a finite family F of graphs and an integer n , the Turán number $ex(n, F)$ of F is the largest integer m such that there exists a graph on n vertices with m edges which contains no member of F as a subgraph.

Conjecture For every finite family F of graphs there exists an $F \in F$ such that $ex(n, F) = O(ex(n, F))$.
